

An L^2 Test Theory for Nonstationary Time Series

Weibiao Wu

University of Chicago, USA

I will discuss testing whether the mean trend of a nonstationary time series is of certain parametric forms. A central limit theorem for the integrated squared error is derived, and with that a hypothesis-testing procedure is proposed. The method is illustrated in a simulation study, and is applied to assess the trend pattern in the central England temperature series. The work is joint with Ting Zhang.
