

**Unsupervised Representation Learning for Identification and Classification of Seismic Signals
and Fault Dynamics**

Maarten V. De Hoop

Department of Mathematics, Rice University, USA

Email: mdehoop@rice.edu

We present a deep learning framework for identification and classification of seismic signals. Furthermore, we introduce approaches for learning fault dynamics and learning source localization. The framework is based on interpretability of the deep neural networks and physics-based architectures, and on an analysis of interior properties of deep neural networks and selective learning.
