*IAS Focused Program of Scattering Amplitudes in Hong Kong*

## Why we like $\mathcal{N} = 4$ SYM

- ✓ Supersymmetric cousin of QCD (extended spectrum of on-shell states)
- ✓ Maximally supersymmetric, conformal four-dimensional gauge theory
- ✓ Is believed to be integrable, in the planar limit at least
- ✓ Remarkable progress in computing scattering amplitudes and correlation functions
- ✓ Use  $\mathcal{N} = 4$  SYM for developing new approaches to computing physical observables in QCD

This talk:

***Compute energy-energy correlations in  $\mathcal{N} = 4$  SYM at weak and at strong coupling***

# $e^+e^-$ annihilation in QCD

- ✓ PETRA (1978-1986) and LEP (1989-2010)

- ✓ A virtual photon or  $Z^0$ –boson decay into quarks and gluons that undergo a hadronization process into hadrons
- ✓ Final states can be described using the class of *infrared finite* observables (event shapes): energy-energy correlations (EEC), thrust, heavy mass, ...
- ✓ Can be computed in perturbative QCD, hadronisation corrections are ‘small’ at high energy

# Energy-energy correlations

- ✓ Function of the angle  $0 \leq \chi \leq \pi$  between detected particles

[Basham, Brown, Ellis, Love]

$$\text{EEC}(\chi) = \left\langle \frac{1}{\Delta\chi} \sum_{a,b} \frac{E_a E_b}{Q^2} \theta(\Delta\chi - |\cos\theta_{ab} - \cos\chi|) \right\rangle_{\text{events}}$$

$$\text{Total energy } \sum_a E_a = Q$$

- ✓ Conventional ('amplitude') approach

$$\text{EEC}(\chi) = \frac{1}{\sigma_{\text{tot}}} \sum_{a,b} \int d\sigma_{a+b+X} \frac{E_a E_b}{Q^2} \delta(\cos\theta_{ab} - \cos\chi)$$

- ✓ Weak coupling expansion in QCD

$$\text{EEC}(\chi) = a_S A(\chi) + a_S^2 B(\chi) + O(a_S^3)$$

- ✓ Current status (1978 – today):

- ✗ Very precise experimental data
- ✗ Poor analytical control,  $B(\chi)$  is known numerically

- ✓ *Final goal: develop more efficient method to computing EEC*

## $e^+e^-$ annihilation in $\mathcal{N} = 4$ SYM

- ✓ Define EEC in  $\mathcal{N} = 4$  SYM and evaluate it at weak/strong coupling

- ✓ From QCD to  $\mathcal{N} = 4$  SYM: introduce an analog of the electromagnetic current

✗ (protected) half-BPS operator built from complex scalar field

$$O_{20'}(x) = \text{tr} [\Phi\Phi]$$

✗ To lowest order in the coupling,  $O_{20'}(x)$  produces a pair of scalars out of the vacuum

✗ For arbitrary coupling, the state  $O_{20'}(x)|0\rangle$  can be decomposed into an infinite sum over on-shell states with an arbitrary number of scalars ( $s$ ), gauginos ( $\lambda$ ) and gauge fields ( $g$ )

$$\int d^4x e^{iqx} O_{20'}(x)|0\rangle = |ss\rangle + |ssg\rangle + |s\lambda\lambda\rangle + \dots$$

# EEC in $\mathcal{N} = 4$ SYM

- ✓ Conventional approach

$$\text{EEC}(\chi) = \frac{1}{\sigma_{\text{tot}}} \sum_{a,b,X} \int d\text{LIPS} |\mathcal{A}_{a+b+X}|^2 \frac{E_a E_b}{Q^2} \delta(\cos \chi - \cos \theta_{ab})$$

- ✓ The amplitude of creation of the final state  $|a, b, X = \text{everything}\rangle$

- ✓ Matrix elements ( $s_{ij} = (p_i + p_j)^2$  with  $p_i^2 = 0$ )

$$|\mathcal{A}_{ss}|^2 = |\langle s(p_1)s(p_2)|O_{\mathbf{20}'}|0\rangle|^2 = \frac{2}{s_{12}} [1 + aF_{\text{virt}}(q^2)]$$

$$|\mathcal{A}_{ssg}|^2 = |\langle s(p_1)s(p_2)g(p_3)|O_{\mathbf{20}'}|0\rangle|^2 = a \frac{s_{12}}{s_{13}s_{23}}$$

$$|\mathcal{A}_{s\lambda\lambda}|^2 = |\langle \lambda(p_1)\lambda(p_2)s(p_3)|O_{\mathbf{20}'}|0\rangle|^2 = a \frac{2}{s_{12}}$$

't Hooft coupling  $a = g_{\text{YM}}^2 N / (4\pi^2)$

# EEC from amplitudes I

- ✓ The total cross section

$$\begin{aligned}\sigma_{\text{tot}}(q) &= \int \text{dLIPS}_2 |\mathcal{A}_{ss}|^2 + \int \text{dLIPS}_3 (|\mathcal{A}_{ssg}|^2 + |\mathcal{A}_{s\lambda\lambda}|^2) + O(a^2) \\ &= \frac{N^2 - 1}{16\pi} [1 + aF_{\text{virt}}(q^2)] + a \int \text{dLIPS}_3 \frac{s_{12}^2 + 2s_{13}s_{23}}{s_{12}s_{13}s_{23}} + O(a^2) = \frac{N^2 - 1}{16\pi} + 0 \cdot a + O(a^2)\end{aligned}$$

- ✓ Energy-energy correlations

$$\text{EEC} = \left[ \int \text{dLIPS}_2 w(p_1, p_2) |\mathcal{A}_{ss}|^2 + \int \text{dLIPS}_3 w(p_1, p_2, p_3) (|\mathcal{A}_{ssg}|^2 + |\mathcal{A}_{s\lambda\lambda}|^2) + O(a^2) \right] / \sigma_{\text{tot}}$$

Weight factors for EEC

$$w(p_1, p_2, \dots) = \sum_{a,b} \frac{E_a E_b}{q^2} \delta(\cos \theta_{ab} - \cos \chi)$$

- ✓ One-loop calculation (unprotected quantity) [Zhiboedov],[Engelund,Roiban]

$$\text{EEC}_{\mathcal{N}=4} = \frac{a}{4z^2(1-z)} \ln \frac{1}{1-z} + O(a^2)$$

IR finite, positive definite function of  $z = (1 - \cos \chi)/2$ ,  $0 < z < 1$

- ✓ Two-loop correction is hard to compute ( $\sim 10^2$  diagrams)

## EEC from amplitudes II

### ✓ Conventional approach

$$\text{EEC}(\chi) = \frac{1}{\sigma_{\text{tot}}} \sum_{a,b,X} \int d\text{LIPS} |\mathcal{A}_{a+b+X}|^2 \frac{E_a E_b}{Q^2} \delta(\cos \chi - \cos \theta_{ab})$$

The amplitude of creation of the final state  $|a, b, X = \text{everything}\rangle$

$$\mathcal{A}_{a+b+X} = \int d^4x e^{iqx} \langle a, b, X | O_{20'}(x) | 0 \rangle$$

### ✓ Main disadvantages:

- ✗ presence of infrared divergences in transition amplitudes  $\mathcal{A}_{a+b+X}$
- ✗ integration over the Lorentz invariant phase space of the final states  $d\text{LIPS}$
- ✗ necessity for summation over all final states  $\sum_X$
- ✗ no analytical results beyond one loop

### ✓ New approach: EEC can be computed from *correlation functions of energy flow operators*

# EEC from correlation functions

- ✓ Total cross section from the optical theorem

$$\begin{aligned}\sigma_{\text{tot}}(q) &= \sum_X (2\pi)^4 \delta^{(4)}(q - p_X) |\mathcal{A}_{O_{20'} \rightarrow X}|^2 \\ &= \int d^4x e^{iqx} \sum_X \langle 0|O^\dagger(0)|X\rangle e^{-ixp_X} \langle X|O(0)|0\rangle \\ &= \int d^4x e^{iqx} \langle 0|O^\dagger(x)O(0)|0\rangle = \frac{1}{16\pi} (N^2 - 1) \theta(q^0) \theta(q^2)\end{aligned}$$

*Wightman correlation function, protected for 1/2-BPS operators*

- ✓ Generalization to EEC

$$\text{EEC} \sim \sum_X \langle 0|O^\dagger(x)|X\rangle w(X) \langle X|O(0)|0\rangle = \langle 0|O^\dagger(x) \mathcal{E}(\vec{n}_1) \mathcal{E}(\vec{n}_2) O(0)|0\rangle$$

*Energy flow operator*

$$\mathcal{E}(\vec{n})|X\rangle = \sum_a E_a \delta^{(2)}(\Omega_{\vec{p}_a} - \Omega_{\vec{n}})|X\rangle$$

- ✓ Relation to the energy-momentum tensor in  $\mathcal{N} = 4$  SYM

[Sveshnikov, Tkachov],[GK, Oderda, Sterman]

$$\mathcal{E}(\vec{n}) = \int_0^\infty dt \lim_{r \rightarrow \infty} r^2 \vec{n}^i T_{0i}(t, r\vec{n})$$

## EEC from correlation functions II

- ✓ Energy flow correlations [GK,Sterman],[Belitsky,GK,Sterman],[Hofman,Maldacena]

$$\langle \mathcal{E}(\vec{n}_1) \mathcal{E}(\vec{n}_2) \rangle_q = \sigma_{\text{tot}}^{-1} \int d^4x e^{iqx} \langle 0 | O^\dagger(x) \mathcal{E}(\vec{n}_1) \mathcal{E}(\vec{n}_2) O(0) | 0 \rangle$$

Energy flow in the direction of  $\vec{n}_1$  and  $\vec{n}_2$

- ✓ Average over the orientations  $\vec{n}_1$  and  $\vec{n}_2$  with the relative angle  $\chi$  kept fixed

$$\text{EEC} = \int d\Omega_1 d\Omega_2 \delta(\vec{n}_1 \cdot \vec{n}_2 - \cos \chi) \langle \mathcal{E}(\vec{n}_1) \mathcal{E}(\vec{n}_2) \rangle_q / q^2$$

- ✓ Multi-fold integral of *Wightman* 4pt function

$$\text{EEC} \sim \underbrace{\int d^4x e^{iqx}}_{\text{Fourier}} \underbrace{\int_0^\infty dt_1 dt_2 \lim_{r_i \rightarrow \infty} r_1^2 r_2^2}_{\text{Detector limit}} \underbrace{\langle 0 | O^\dagger(x) T_{0\vec{n}_1}(x_1) T_{0\vec{n}_2}(x_2) O(0) | 0 \rangle}_{\text{Wightman corr. function}} \Big|_{x_i = (t, r\vec{n}_i)}$$

- ✗ Compute corr.function  $\langle O^\dagger(x) T(x_1) T(x_2) O(0) \rangle$  in Euclid
- ✗ Continue to Minkowski with Wightman prescription
- ✗ Take detector limit + perform Fourier

## Correlation functions in $\mathcal{N} = 4$ SYM

- ✓ Quantum corrections to various correlation functions are determined by the same scalar function

$$\langle O(x_1)O(x_2)O(x_3)O(x_4) \rangle_E = \frac{1}{x_{12}^2 x_{23}^2 x_{34}^2 x_{41}^2} \Phi(u, v; a)$$

$$\langle O(x_1)T(x_2)T(x_3)O(x_4) \rangle_E = \frac{1}{(x_{12}^2 x_{23}^2 x_{34}^2)^2} P(\partial_u, \partial_v) \Phi(u, v; a)$$

Conformal ratios

$$u = x_{12}^2 x_{34}^2 / (x_{13}^2 x_{24}^2), \quad v = x_{23}^2 x_{41}^2 / (x_{13}^2 x_{24}^2)$$

- ✓ Universal function in  $\mathcal{N} = 4$  SYM at weak coupling

[Eden, Schubert, Sokatchev], [Bianchi et al]

$$\begin{aligned} \Phi(u, v) = & a \Phi^{(1)}(u, v) + a^2 \left( \frac{1}{2} (1 + u + v) \left[ \Phi^{(1)}(u, v) \right]^2 \right. \\ & \left. + 2 \left[ \Phi^{(2)}(u, v) + \frac{1}{u} \Phi^{(2)}(v/u, 1/u) + \frac{1}{v} \Phi^{(2)}(1/v, u/v) \right] \right) + O(a^3) \end{aligned}$$

$\Phi^{(1)}(u, v)$  'box' integral,  $\Phi^{(2)}(u, v)$  'double' box integral

- ✓  $\mathcal{N} = 4$  superconf. symmetry allows us to determine  $\Phi_{\text{weak}}(u, v)$  to six loops [Eden, Heslop, GK, Sokatchev]

- ✓ AdS/CFT correspondences predicts  $\Phi(u, v)$  at strong coupling

[Arutyunov, Frolov]

## From Euclid to Minkowski

- ✓ Brute force method: compute anew using Schwinger-Keldysh technique (too hard)
- ✓ Better method: analytically continue correlation functions from Euclid to Minkowski+Wightman
- ✓ Warm-up example: free scalar propagator  $D_{\text{Euclid}}(x) = \langle \phi(x)\phi(0) \rangle \sim 1/x^2$

$$\begin{aligned} \langle 0|\phi(x)\phi(0)|0\rangle &= \sum_n \langle 0|\phi(x)|n\rangle \langle n|\phi(0)|0\rangle \\ &= \sum_{E_n > 0} e^{-iE_n(x^0 - i0) + i\vec{p}\vec{x}} \langle 0|\phi(0)|n\rangle \langle n|\phi(0)|0\rangle \sim \frac{1}{(x^0 - i0)^2 - \vec{x}^2} \end{aligned}$$

- ✓ How to get Wightman correlation functions ('magic' recipe)

[Mack]

- ✗ Go to Mellin space:

$$\Phi_{\text{Euclid}} = \int_{-\delta - i\infty}^{-\delta + i\infty} \frac{dj_1 dj_2}{(2\pi i)^2} M(j_1, j_2; a) u^{j_1} v^{j_2}, \quad u = \frac{x_{12}^2 x_{34}^2}{x_{13}^2 x_{24}^2}, \quad v = \frac{x_{23}^2 x_{41}^2}{x_{13}^2 x_{24}^2}$$

- ✗ Substitute  $x_{ij}^2 \rightarrow x_{ij,+}^2 = x_{ij}^2 - i0 \cdot x_{ij}^0$

$$\Phi_{\text{Wightman}} = \int_{-\delta - i\infty}^{-\delta + i\infty} \frac{dj_1 dj_2}{(2\pi i)^2} M(j_1, j_2; a) \left( \frac{x_{12,+}^2 x_{34,+}^2}{x_{13,+}^2 x_{24,+}^2} \right)^{j_1} \left( \frac{x_{23,+}^2 x_{41,+}^2}{x_{13,+}^2 x_{24,+}^2} \right)^{j_2}$$

- ✓  $M(j_1, j_2; a)$  is known both at weak and strong coupling in planar  $\mathcal{N} = 4$  SYM

# All-loop prediction for EEC

Master formula

$$\text{EEC}(\chi) = \frac{1}{4z^2(1-z)} \int_{-\delta-i\infty}^{-\delta+i\infty} \frac{dj_1 dj_2}{(2\pi i)^2} \underbrace{M(j_1, j_2; a)}_{\text{corr. function}} \underbrace{K(j_1, j_2)}_{\text{detector}} \underbrace{\left(\frac{1-z}{z}\right)^{j_1+j_2}}_{\text{angular dependence}}$$

The dependence on the angle  $\chi$  enters through

$$z = (1 - \cos \chi)/2, \quad 0 < z < 1$$

Detector function is independent on the coupling

$$K(j_1, j_2) = \frac{2\Gamma(1-j_1-j_2)}{\Gamma(j_1+j_2)[\Gamma(1-j_1)\Gamma(1-j_2)]^2}$$

The dependence on the coupling constant resides in the Mellin amplitude

$$\Phi(u, v; a) = \int_{-\delta-i\infty}^{-\delta+i\infty} \frac{dj_1 dj_2}{(2\pi i)^2} M(j_1, j_2; a) u^{j_1} v^{j_2}$$

$$M(j_1, j_2; a) = \underbrace{aM^{(1)}(j_1, j_2) + a^2M^{(2)}(j_1, j_2) + \dots}_{\text{are known}}$$

## Warm up exercise

- ✓ Master formula at one loop

$$\text{EEC}^{(1\text{-loop})} = \frac{a}{4z^2(1-z)} \int_{-\delta-i\infty}^{-\delta+i\infty} \frac{dj_1 dj_2}{(2\pi i)^2} M^{(1)}(j_1, j_2; a) K(j_1, j_2) \left( \frac{1-z}{z} \right)^{j_1+j_2}$$

Mellin amplitude

$$M^{(1)}(j_1, j_2) = -\frac{1}{4} [\Gamma(-j_1)\Gamma(-j_2)\Gamma(1+j_1+j_2)]^2$$

$$K(j_1, j_2) = \frac{2\Gamma(1-j_1-j_2)}{\Gamma(j_1+j_2)[\Gamma(1-j_1)\Gamma(1-j_2)]^2}$$

- ✓ Change integration variable  $j_1 + j_2 \rightarrow j_1$

$$\begin{aligned} \text{EEC}^{(1\text{-loop})} &= -\frac{a}{4z^2(1-z)} \int \frac{dj_1 dj_2}{(2\pi i)^2} \frac{j_1^2}{2(j_1-j_2)^2 j_2^2} \frac{\pi}{\sin(\pi j_1)} \left( \frac{1-z}{z} \right)^{j_1} \\ &= \frac{a}{4z^2(1-z)} \int \frac{dj_1}{2\pi i} \frac{\pi}{j_1 \sin(\pi j_1)} \left( \frac{1-z}{z} \right)^{j_1} \\ &= \frac{a}{4z^2(1-z)} \sum_{k=-1}^{-\infty} \frac{(-1)^k}{k} \left( \frac{1-z}{z} \right)^k \\ &= \frac{a}{4z^2(1-z)} \ln \frac{1}{1-z} \end{aligned}$$

## EEC at two loops

Final result for EEC

$$\text{EEC}_{\mathcal{N}=4} = \frac{1}{4z^2(1-z)} \left\{ aF_1(z) + a^2 \left[ (1-z)F_2(z) + \frac{1}{4}F_3(z) \right] + O(a^3) \right\}, \quad z = \frac{1}{2}(1 - \cos \chi)$$

$F_w(z)$  are linear combinations of functions of homogenous weight  $w = 1, 2, 3$

$$F_1(z) = -\ln(1-z)$$

$$F_2(z) = 4\sqrt{z} \left[ \text{Li}_2(-\sqrt{z}) - \text{Li}_2(\sqrt{z}) + \frac{1}{2} \ln z \ln \left( \frac{1+\sqrt{z}}{1-\sqrt{z}} \right) \right] \\ + (1+z) \left[ 2\text{Li}_2(z) + \ln^2(1-z) \right] + 2 \ln(1-z) \ln \left( \frac{z}{1-z} \right) + z \frac{\pi^2}{3},$$

$$F_3(z) = (1-z)(1+2z) \left[ \ln^2 \left( \frac{1+\sqrt{z}}{1-\sqrt{z}} \right) \ln \left( \frac{1-z}{z} \right) - 8\text{Li}_3 \left( \frac{\sqrt{z}}{\sqrt{z}-1} \right) - 8\text{Li}_3 \left( \frac{\sqrt{z}}{\sqrt{z}+1} \right) \right] \\ - 4(z-4)\text{Li}_3(z) + 6(3+3z-4z^2)\text{Li}_3 \left( \frac{z}{z-1} \right) - 2z(1+4z)\zeta_3 + 2[(3-4z)z \ln z \\ + 2(2z^2 - z - 2) \ln(1-z)] \text{Li}_2(z) + \frac{1}{3} \ln^2(1-z) [4(3z^2 - 2z - 1) \ln(1-z) \\ + 3(3-4z)z \ln z] + \frac{\pi^2}{3} [2z^2 \ln z - (2z^2 + z - 2) \ln(1-z)]$$

## From weak to strong coupling

- ✓ At weak coupling  $\text{EEC}_{\mathcal{N}=4}$  has a shape which is remarkably similar to the one in QCD
- ✓ Going from **one** to **two** loops, EEC flattens
- ✓ This agrees with strong coupling prediction for EEC in planar  $\mathcal{N} = 4$  SYM

[Hofman, Maldacena]

$$\text{EEC}_{\mathcal{N}=4} \stackrel{a \rightarrow \infty}{\sim} \frac{1}{2} \left[ 1 + a^{-1} (1 - 6z(1 - z)) + O(a^{-3/2}) \right]$$

No jets at strong coupling

# End-point asymptotics I

Small angle correlations  $\chi \rightarrow 0$  (or  $z \sim \chi^2 \rightarrow 0$ ): calorimeters measure nearly collinear particles

$$\text{EEC} \stackrel{z \rightarrow 0}{\sim} \frac{a}{4z} \left[ 1 + a \left( \ln z - \frac{1}{2} \zeta_3 + \zeta_2 - 3 \right) \right]$$

- ✓ Corrections are enhanced by  $\ln z$ , no homogenous transcendentality
- ✓ Resummation of leading log's  $a(a \ln z)^k$  using the “jet calculus”

[Konishi, Ukawa, Veneziano]

$$\begin{aligned} \text{EEC} &\stackrel{z \rightarrow 0}{\sim} \frac{a}{4z} \int_0^1 dx x^2 D(x, Q^2/S_{ab}) \\ &= \frac{a}{4z} (Q^2/S_{ab})^{-\gamma_T(3)} = \frac{a}{4} z^{-1+\gamma_T(3)} \end{aligned}$$

$\gamma_T(3) = a + O(a^2)$  – twist-2 *time-like* anomalous dimension of spin  $S = 3$

$D(x, Q^2/S_{ab})$  probability to fragment into a pair of partons with  $S_{ab} = 2E_a E_b (1 - \cos \chi) \sim Q^2 z$

- ✓ Resummation weakens singularity of EEC for  $\chi \rightarrow 0$ , jets at weak coupling

$$\int_0^{\chi_0} d \cos \chi \text{EEC} \sim \frac{a}{\gamma_T(3)} \sim 1, \quad (\chi_0 \ll 1)$$

## End-point asymptotics II

EEC in the back-to-back kinematics  $\chi \rightarrow \pi$  (or  $y \equiv 1 - z \sim (\pi - \chi)^2 \rightarrow 0$ )

$$\text{EEC} \stackrel{z \rightarrow 1}{\sim} \frac{1}{4y} \left\{ a \ln(1/y) - \frac{a^2}{2} \left[ \ln^3(1/y) + \frac{\pi^2}{2} \ln(1/y) \right] \right\}$$

✓ Large (Sudakov) corrections  $a^k (\ln y)^n$  come from the emission of soft and collinear particles

✓ All order resummation

[Collins, Soper]

$$\text{EEC} \sim \frac{1}{8y} H(a) \int_0^\infty db b J_0(b) S(b^2/y; a)$$

$J_0(b)$  Bessel function;  $S(b^2/y; a)$  the Sudakov form factor (with  $b_0 = 2 e^{-\gamma_E}$ )

$$S = \exp \left[ -\frac{1}{2} \Gamma_{\text{cusp}}(a) \ln^2 \left( \frac{b^2}{y b_0^2} \right) - \Gamma(a) \ln \left( \frac{b^2}{y b_0^2} \right) \right]$$

Dependence on the coupling constant is encoded in three functions

$$\Gamma_{\text{cusp}}(a) = a - \frac{1}{2} \zeta_2 a^2, \quad \Gamma(a) = -\frac{3}{2} \zeta_3 a^2, \quad H(a) = 1 - \zeta_2 a$$

✓ Perturbative corrections to  $\text{EEC}(z \rightarrow 1)$  have homogeneous transcendentality

$$[\text{EEC}_{\text{QCD}}(z \rightarrow 1)]_{\text{maximal transcendentality}} = \text{EEC}_{\mathcal{N}=4}(z \rightarrow 1)$$

## Conclusions and open questions

- ✓ Energy correlations are good/nontrivial physical observables in  $\mathcal{N} = 4$  SYM
- ✓ Relation to energy-energy correlations in QCD (most complicated part)?
- ✓ All symmetries of  $\mathcal{N} = 4$  SYM are preserved, what is the manifestation of integrability?
- ✓ Interpolation between weak and strong coupling?
- ✓ Other proposals for 'good' observables?
