

Generalized BCFW Recursion Relation with Boundary Terms

Junjie Rao

Zhejiang University

Nov 20, 2014

BCFW Recursion Relation

- The formula [Britto, Cachazo, Feng & Witten, '05] :

$$A = \sum_{\alpha} A_L(\hat{z}_{\alpha}) \frac{1}{p_{\alpha}^2} A_R(\hat{z}_{\alpha}). \quad (1)$$

The full amplitude can be reconstructed by lower-point amplitudes according to its factorization properties.

BCFW Recursion Relation

- The formula [Britto, Cachazo, Feng & Witten, '05] :

$$A = \sum_{\alpha} A_L(\hat{z}_{\alpha}) \frac{1}{p_{\alpha}^2} A_R(\hat{z}_{\alpha}). \quad (1)$$

The full amplitude can be reconstructed by lower-point amplitudes according to its factorization properties.

- Its derivation: Deform a spinor pair $\langle i|j \rangle$ as

$$|i\rangle \rightarrow |i\rangle + z|j\rangle, \quad |j\rangle \rightarrow |j\rangle - z|i\rangle, \quad (2)$$

$$p_{\alpha}^2 \rightarrow p_{\alpha}^2 - z\langle i|p_{\alpha}|j\rangle, \quad i \in p_{\alpha}, \quad j \notin p_{\alpha}. \quad (3)$$

All momenta remain null and momentum conservation still holds.

$$\oint_0 \frac{dz}{z} A(z) + \sum_{p_{\alpha}^2=0} \oint \frac{dz}{z} A(z) = \oint_{\infty} \frac{dz}{z} A(z) = B. \quad (4)$$

- Good deformations do not have boundary terms.

$$\lim_{z \rightarrow \infty} A(z) = 0 \implies B = 0. \quad (5)$$

But how to select good ones?

- Good deformations do not have boundary terms.

$$\lim_{z \rightarrow \infty} A(z) = 0 \implies B = 0. \quad (5)$$

But how to select good ones?

- By applying the background field method, when the amplitude contains **at least one gluon or graviton**, there always exists one good deformation [N. Arkani-Hamed & J. Kaplan, '08; C. Cheung, '08] .

- Good deformations do not have boundary terms.

$$\lim_{z \rightarrow \infty} A(z) = 0 \implies B = 0. \quad (5)$$

But how to select good ones?

- By applying the background field method, when the amplitude contains **at least one gluon or graviton**, there always exists one good deformation [N. Arkani-Hamed & J. Kaplan, '08; C. Cheung, '08] .
- What about interaction theories of scalars and fermions, *i.e.*, the Yukawa theory?

- Good deformations do not have boundary terms.

$$\lim_{z \rightarrow \infty} A(z) = 0 \implies B = 0. \quad (5)$$

But how to select good ones?

- By applying the background field method, when the amplitude contains **at least one gluon or graviton**, there always exists one good deformation [N. Arkani-Hamed & J. Kaplan, '08; C. Cheung, '08] .
- What about interaction theories of scalars and fermions, *i.e.*, the Yukawa theory?
- When it is unavoidable to encounter boundary terms, how can one calculate them, and what information do they imply?

Proposals to Handle Boundary Terms

- (1) Add **auxiliary fields** to heal the large z behavior

[P. Benincasa & F. Cachazo, '07; R. H. Boels, '10]

It is unknown in general whether the enlarged theory exists, or how to construct it if it exists. And the parental amplitudes could be far more complicated than expected.

Proposals to Handle Boundary Terms

- (1) Add **auxiliary fields** to heal the large z behavior

[P. Benincasa & F. Cachazo, '07; R. H. Boels, '10]

It is unknown in general whether the enlarged theory exists, or how to construct it if it exists. And the parental amplitudes could be far more complicated than expected.

- (2) Analyze **Feynman diagrams** to isolate their boundary terms

[B. Feng, J. Wang, Y. Wang & Z. Zhang, '09; B. Feng & C. Y. Liu, '10; B. Feng & Z. Zhang, '11]

It is useful only when boundary terms are located on merely a few Feynman diagrams.

 It is unknown in general whether the enlarged theory exists, or how to construct it if it exists. And the parental amplitudes could be far more complicated than expected.
- (2) Analyze **Feynman diagrams** to isolate their boundary terms
 [B. Feng, J. Wang, Y. Wang & Z. Zhang, '09; B. Feng & C. Y. Liu, '10; B. Feng & Z. Zhang, '11]
 It is useful only when boundary terms are located on merely a few Feynman diagrams.
- (3) Express boundary terms in terms of **roots of amplitudes**
 [P. Benincasa & E. Conde, '11; B. Feng, Y. Jia, H. Luo & M. Luo, '11]
 It is extremely challenging to find roots.

 [P. Benincasa & E. Conde, '11; B. Feng, Y. Jia, H. Luo & M. Luo, '11]
 It is extremely challenging to find roots.
- A universal, systematic approach is still lacking.

The New Algorithm

More careful analysis: What's wrong with bad deformations?

- A deformation is an injection of large z , so it may have the 'short-circuit' problem: the large complex momentum flow misses part of all physical channels.

The New Algorithm

More careful analysis: What's wrong with bad deformations?

- A deformation is an injection of large z , so it may have the 'short-circuit' problem: the large complex momentum flow misses part of all physical channels.
- Multiple deformations have **overlapping** detected channels, how to deal with the overcounting?

The New Algorithm

More careful analysis: What's wrong with bad deformations?

- A deformation is an injection of large z , so it may have the 'short-circuit' problem: the large complex momentum flow misses part of all physical channels.
- Multiple deformations have **overlapping** detected channels, how to deal with the overcounting?
- Two-particle channels are special: They factorize into holomorphic and anti-holomorphic parts, *i.e.*, $p_{ij}^2 = \langle ij \rangle [ij]$.

- The prelude: Reconstructing amplitudes by factorization limits
[K. Zhou & C. Qiao, '14]

- The prelude: Reconstructing amplitudes by factorization limits
[K. Zhou & C. Qiao, '14]
- A universal, systematic algorithm
[B. Feng, K. Zhou, C. Qiao & JR, 3 weeks ago]

- The prelude: Reconstructing amplitudes by factorization limits
[K. Zhou & C. Qiao, '14]
- A universal, systematic algorithm
[B. Feng, K. Zhou, C. Qiao & JR, 3 weeks ago]
- More symbolic abstraction: **Extraction operator formalism**
[JR, 2 weeks ago]

Extraction Operator Formalism

- For a general BCFW deformation $\langle i_t | j_t \rangle$ which detects physical poles in the set D^t , define

$$P^t A \equiv - \sum_{\text{pole} \in \mathcal{D}^t} \oint \frac{dz_t}{z_t} A(z_t), \quad C^t A \equiv \oint_{\infty} \frac{dz_t}{z_t} A(z_t), \quad (6)$$

P^t and C^t are the pole and constant extraction operators respectively, with $P^t + C^t = I^t$. In the beginning C^0 is unknown, but P^0 represents exactly the BCFW recursion relation. A convenient operator notation is $O^{ij} \equiv O^i O^j$.

Extraction Operator Formalism

- For a general BCFW deformation $\langle i_t | j_t \rangle$ which detects physical poles in the set D^t , define

$$P^t A \equiv - \sum_{\text{pole} \in \mathcal{D}^t} \oint \frac{dz_t}{z_t} A(z_t), \quad C^t A \equiv \oint_{\infty} \frac{dz_t}{z_t} A(z_t), \quad (6)$$

P^t and C^t are the pole and constant extraction operators respectively, with $P^t + C^t = I^t$. In the beginning C^0 is unknown, but P^0 represents exactly the BCFW recursion relation.

A convenient operator notation is $O^{ij} \equiv O^i O^j$.

- Expanding I^i repeatedly, yields

$$I^{10} = P^1 + C^1 I^0 = P^1 + C^1 P^0 + C^{10}, \quad (7)$$

$$I^{210} = P^2 + C^2 I^{10} = P^2 + C^2 P^1 + C^{21} P^0 + C^{210}, \quad (8)$$

$$I^{3210} = P^3 + C^3 I^{210} = P^3 + C^3 P^2 + C^{32} P^1 + C^{321} P^0 + C^{3210}. \quad (9)$$

- If I^{3210} covers all possible physical poles and the final expression is **free of spurious poles**, we can set $C^{3210} = 0$, hence

$$I^{3210} = P^3 + C^3 P^2 + C^{32} P^1 + C^{321} P^0. \quad (10)$$

When a spurious pole is encountered, we must perform an I^s operation to detect it and **kill it with C^s** .

- If I^{3210} covers all possible physical poles and the final expression is **free of spurious poles**, we can set $C^{3210} = 0$, hence

$$I^{3210} = P^3 + C^3 P^2 + C^{32} P^1 + C^{321} P^0. \quad (10)$$

When a spurious pole is encountered, we must perform an I^s operation to detect it and **kill it with C^s** .

- This algorithm is called the **CP scheme**, where at each step we extract the constant part from the pole part of last step accumulatively. Another equivalent representation is the **PC scheme**:

$$I^{10} = P^0 + I^1 C^0 = P^0 + P^1 C^0 + C^{10}, \quad (11)$$

$$P^1 C^0 = P_{\mathcal{D}^1 \setminus \mathcal{D}^1 \cap \mathcal{D}^0}^1 (I - P^0). \quad (12)$$

- If I^{3210} covers all possible physical poles and the final expression is **free of spurious poles**, we can set $C^{3210} = 0$, hence

$$I^{3210} = P^3 + C^3 P^2 + C^{32} P^1 + C^{321} P^0. \quad (10)$$

When a spurious pole is encountered, we must perform an I^s operation to detect it and **kill it with C^s** .

- This algorithm is called the **CP scheme**, where at each step we extract the constant part from the pole part of last step accumulatively. Another equivalent representation is the **PC scheme**:

$$I^{10} = P^0 + I^1 C^0 = P^0 + P^1 C^0 + C^{10}, \quad (11)$$

$$P^1 C^0 = P_{\mathcal{D}^1 \setminus \mathcal{D}^1 \cap \mathcal{D}^0}^1 (I - P^0). \quad (12)$$

- We should only consider new poles because **each physical pole only appears once**. This is more than the '**Schmidt orthogonalization**'.

■ More steps of expansions:

$$I^{210} = P^0 + P^1 C^0 + P^2 C^{10} + C^{210}, \quad (13)$$

$$P^2 C^{10} = P_{\mathcal{D}^2 \setminus \mathcal{D}^2 \cap (\mathcal{D}^1 \cup \mathcal{D}^0)}^2 (I - P^0 - P^1 C^0), \quad (14)$$

and

$$I^{3210} = P^0 + P^1 C^0 + P^2 C^{10} + P^3 C^{210} + C^{3210}, \quad (15)$$

$$P^3 C^{210} = P_{\mathcal{D}^3 \setminus \mathcal{D}^3 \cap (\mathcal{D}^2 \cup \mathcal{D}^1 \cup \mathcal{D}^0)}^3 (I - P^0 - P^1 C^0 - P^2 C^{10}). \quad (16)$$

- More steps of expansions:

$$I^{210} = P^0 + P^1 C^0 + P^2 C^{10} + C^{210}, \quad (13)$$

$$P^2 C^{10} = P_{\mathcal{D}^2 \setminus \mathcal{D}^2 \cap (\mathcal{D}^1 \cup \mathcal{D}^0)}^2 (I - P^0 - P^1 C^0), \quad (14)$$

and

$$I^{3210} = P^0 + P^1 C^0 + P^2 C^{10} + P^3 C^{210} + C^{3210}, \quad (15)$$

$$P^3 C^{210} = P_{\mathcal{D}^3 \setminus \mathcal{D}^3 \cap (\mathcal{D}^2 \cup \mathcal{D}^1 \cup \mathcal{D}^0)}^3 (I - P^0 - P^1 C^0 - P^2 C^{10}). \quad (16)$$

- Visually at each step we extract the pole part from the constant part of last step accumulatively, but in fact **we express all constant extractions in terms of pole extractions.**

- More steps of expansions:

$$I^{210} = P^0 + P^1 C^0 + P^2 C^{10} + C^{210}, \quad (13)$$

$$P^2 C^{10} = P_{\mathcal{D}^2 \setminus \mathcal{D}^2 \cap (\mathcal{D}^1 \cup \mathcal{D}^0)}^2 (I - P^0 - P^1 C^0), \quad (14)$$

and

$$I^{3210} = P^0 + P^1 C^0 + P^2 C^{10} + P^3 C^{210} + C^{3210}, \quad (15)$$

$$P^3 C^{210} = P_{\mathcal{D}^3 \setminus \mathcal{D}^3 \cap (\mathcal{D}^2 \cup \mathcal{D}^1 \cup \mathcal{D}^0)}^3 (I - P^0 - P^1 C^0 - P^2 C^{10}). \quad (16)$$

- Visually at each step we extract the pole part from the constant part of last step accumulatively, but in fact **we express all constant extractions in terms of pole extractions.**
- If a spurious pole appears, the same additional I^s is used to kill it.

Algebraic properties: Projectivity and commutativity

- It is easier to manipulate C^i 's, and P^i 's follow from $P^i = I - C^i$.

$$C^i C^i = C^i, \quad C^i C^j = C^j C^i. \quad (17)$$

Algebraic properties: Projectivity and commutativity

- It is easier to manipulate C^i 's, and P^i 's follow from $P^i = I - C^i$.

$$C^i C^i = C^i, \quad C^i C^j = C^j C^i. \quad (17)$$

- Performing the same deformation twice is equivalent to replacing z_i by $(z_i + z'_i)$, hence the constant term remains the same. From a dual expansion of A in both z_i and z_j , the constant term is with respect to both variables, hence the order to perform two trivial contour integrals around infinity is irrelevant.

Algebraic properties: Projectivity and commutativity

- It is easier to manipulate C^i 's, and P^i 's follow from $P^i = I - C^i$.

$$C^i C^i = C^i, \quad C^i C^j = C^j C^i. \quad (17)$$

- Performing the same deformation twice is equivalent to replacing z_i by $(z_i + z'_i)$, hence the constant term remains the same. From a dual expansion of A in both z_i and z_j , the constant term is with respect to both variables, hence the order to perform two trivial contour integrals around infinity is irrelevant.
- From above one can derive

$$P^i P^i = P^i, \quad C^i P^i = P^i C^i = 0, \quad P^i P^j = P^j P^i, \quad C^i P^j = P^j C^i. \quad (18)$$

Then each term in an expansion of either PC or CP scheme is 'orthogonal' to the others. But we already have a stronger condition: Each physical pole only appears once.

Tricks in practical applications

- Assume $I^{3210} = (\dots) + C^{3210}$ is obtained, we can further expand it either as (PC scheme)

$$I^{43210} = (\dots) + P^4 C^{3210} + C^{43210}, \quad (19)$$

or (CP scheme)

$$I^{43210} = P^4 + C^4(\dots) + C^{43210}. \quad (20)$$

One can freely change the scheme **for convenience** at any step.

Tricks in practical applications

- Assume $I^{3210} = (\dots) + C^{3210}$ is obtained, we can further expand it either as (PC scheme)

$$I^{43210} = (\dots) + P^4 C^{3210} + C^{43210}, \quad (19)$$

or (CP scheme)

$$I^{43210} = P^4 + C^4(\dots) + C^{43210}. \quad (20)$$

One can freely change the scheme **for convenience** at any step.

- The **'last good deformation' corollary** in the CP scheme:
In above if I^{43210} covers all physical poles, then if

$$C^4(\dots) = 0, \quad (21)$$

step 4 must be a good deformation.

A Little Digression

C versus P : A consistency check (analytically)

- For an n -point amplitude, all $\langle ij \rangle$'s are:

$$\begin{array}{cccccc}
 \langle 12 \rangle & & & & & \\
 \langle 13 \rangle & \langle 23 \rangle & & & & \\
 \langle 14 \rangle & \langle 24 \rangle & \langle 34 \rangle & & & \\
 \langle 15 \rangle & \langle 25 \rangle & \langle 35 \rangle & \langle 45 \rangle & & \\
 \vdots & \vdots & \vdots & \vdots & \ddots & \\
 \langle 1n \rangle & \langle 2n \rangle & \langle 3n \rangle & \langle 4n \rangle & \dots & \langle n-1, n \rangle
 \end{array} \tag{22}$$

A Little Digression

C versus P : A consistency check (analytically)

- For an n -point amplitude, all $\langle ij \rangle$'s are:

$$\begin{array}{cccccc}
 \langle 12 \rangle & & & & & \\
 \langle 13 \rangle & \langle 23 \rangle & & & & \\
 \langle 14 \rangle & \langle 24 \rangle & \langle 34 \rangle & & & \\
 \langle 15 \rangle & \langle 25 \rangle & \langle 35 \rangle & \langle 45 \rangle & & \\
 \vdots & \vdots & \vdots & \vdots & \ddots & \\
 \langle 1n \rangle & \langle 2n \rangle & \langle 3n \rangle & \langle 4n \rangle & \dots & \langle n-1, n \rangle
 \end{array} \tag{22}$$

- For $i, j \neq 1, 2$ one can solve all independent Schouten identities via

$$\langle ij \rangle = \frac{1}{\langle 12 \rangle} \begin{vmatrix} \langle 1i \rangle & \langle 2i \rangle \\ \langle 1j \rangle & \langle 2j \rangle \end{vmatrix}. \tag{23}$$

There are C_{n-2}^2 Schouten identities, hence **so far** there are $C_n^2 - C_{n-2}^2 = 2n - 3$ independent $\langle ij \rangle$'s left.

- Same for $[ij]$'s:

$$\begin{array}{cc}
 \langle 12 \rangle & [12] \\
 \langle 13 \rangle & \langle 23 \rangle & [13] & [23] \\
 \vdots & \vdots & \vdots & \vdots \\
 \langle 1n \rangle & \langle 2n \rangle & [1n] & [2n]
 \end{array} \tag{24}$$

- Same for $[ij]$'s:

$$\begin{array}{cc}
 \langle 12 \rangle & [12] \\
 \langle 13 \rangle & \langle 23 \rangle & [13] & [23] \\
 \vdots & \vdots & \vdots & \vdots \\
 \langle 1n \rangle & \langle 2n \rangle & [1n] & [2n]
 \end{array} \tag{24}$$

- Momentum conservation can solve four variables via

$$\begin{aligned}
 \langle 1 | \sum P | 1 \rangle = 0 : & \quad \langle 13 \rangle [13] + \langle 14 \rangle [14] = -\Sigma_{11} - \langle 12 \rangle [12], \\
 \langle 2 | \sum P | 1 \rangle = 0 : & \quad \langle 23 \rangle [13] + \langle 24 \rangle [14] = -\Sigma_{21}, \\
 \langle 1 | \sum P | 2 \rangle = 0 : & \quad \langle 13 \rangle [23] + \langle 14 \rangle [24] = -\Sigma_{12}, \\
 \langle 2 | \sum P | 2 \rangle = 0 : & \quad \langle 23 \rangle [23] + \langle 24 \rangle [24] = -\Sigma_{22} - \langle 12 \rangle [12],
 \end{aligned} \tag{25}$$

where $\Sigma_{ij} = \sum_{k=5}^n \langle ik \rangle [jk]$. Now only $(4n - 10)$ independent kinematic variables are left.

$$\begin{aligned}

Applications

Yukawa with ϕ^4

- Color-ordered amplitude $A(1^-, 2^+, 3, 4, 5, 6)$: 1^- and 2^+ are fermions and the rest are scalars. There are Yukawa coupling g and ϕ^4 coupling λ .

Applications

Yukawa with ϕ^4

- Color-ordered amplitude $A(1^-, 2^+, 3, 4, 5, 6)$: 1^- and 2^+ are fermions and the rest are scalars. There are Yukawa coupling g and ϕ^4 coupling λ .

- Observe that: $\langle 5|6]$ deformation detects $[16]$ and s_{345} , $\langle 3|4]$ deformation detects $\langle 23]$ and s_{456} , $\langle 4|5]$ deformation detects s_{234} . $\langle 16]$ and $[23]$ are excluded by the helicity configuration $(1^-, 2^+)$.

Applications

Yukawa with ϕ^4

- Color-ordered amplitude $A(1^-, 2^+, 3, 4, 5, 6)$: 1^- and 2^+ are fermions and the rest are scalars. There are Yukawa coupling g and ϕ^4 coupling λ .

- Observe that: $\langle 5|6]$ deformation detects $[16]$ and s_{345} , $\langle 3|4]$ deformation detects $\langle 23]$ and s_{456} , $\langle 4|5]$ deformation detects s_{234} . $\langle 16]$ and $[23]$ are excluded by the helicity configuration $(1^-, 2^+)$.
- These are **all bad** BCFW deformations.

- In the CP scheme,

$$A = P^{\langle 4|5]} A + C^{\langle 4|5]} P^{\langle 3|4]} A + C^{\langle 4|5]} \langle 3|4]} P^{\langle 5|6]} A, \quad (26)$$

where $C^{\langle 4|5]} \langle 3|4]} \langle 5|6]} A = 0$, if there is no unexpected spurious pole.

- In the CP scheme,

$$A = P^{\langle 4|5]} A + C^{\langle 4|5]} P^{\langle 3|4]} A + C^{\langle 4|5]} \langle 3|4]} P^{\langle 5|6]} A, \quad (26)$$

where $C^{\langle 4|5]} \langle 3|4]} \langle 5|6]} A = 0$, if there is no unexpected spurious pole.

- Start with ordinary BCFW recursion for $\langle 5|6]$,

$$P^{\langle 5|6]} A = P_{[16]}^{\langle 5|6]} A + P_{s_{345}}^{\langle 5|6]} A = c_B \frac{[65][1|2+4|3]}{[15][16]\langle 32\rangle p_{234}^2} - c_A \frac{[62]}{[61]} \frac{1}{p_{345}^2}, \quad (27)$$

where $c_A = g^2 \lambda$ and $c_B = g^4$. Also $|-p\rangle = |p\rangle$ and $[-p| = -|p|$.

- In the CP scheme,

$$A = P^{\langle 4|5]} A + C^{\langle 4|5]} P^{\langle 3|4]} A + C^{\langle 4|5]} \langle 3|4]} P^{\langle 5|6]} A, \quad (26)$$

where $C^{\langle 4|5]} \langle 3|4]} \langle 5|6]} A = 0$, if there is no unexpected spurious pole.

- Start with ordinary BCFW recursion for $\langle 5|6]$,

$$P^{\langle 5|6]} A = P_{[16]}^{\langle 5|6]} A + P_{s_{345}}^{\langle 5|6]} A = c_B \frac{[65][1|2+4|3\rangle}{[15][16]\langle 32\rangle p_{234}^2} - c_A \frac{[62]}{[61]} \frac{1}{p_{345}^2}, \quad (27)$$

where $c_A = g^2 \lambda$ and $c_B = g^4$. Also $|-p\rangle = |p\rangle$ and $[-p| = -|p|$.

- Extract the constant term with respect to $\langle 3|4]$,

$$C^{\langle 3|4]} P^{\langle 5|6]} A = c_B \frac{[65][1|2+3|4\rangle}{[15][16]\langle 42\rangle p_{234}^2} - c_A \frac{[62]}{[61]} \frac{1}{p_{345}^2}. \quad (28)$$

- Same for $\langle 3|4]$,

$$\begin{aligned}
 P^{\langle 3|4]} A + C^{\langle 3|4]} P^{\langle 5|6]} A = & c_B \left(-\frac{\langle 34 \rangle [6|1 + 5|2]}{\langle 24 \rangle [16] \langle 32 \rangle p_{234}^2} + \frac{[65] [1|2 + 3|4]}{[15] [16] \langle 42 \rangle p_{234}^2} \right) \\
 & + c_A \left(\frac{\langle 31 \rangle}{\langle 32 \rangle} \frac{1}{p_{456}^2} - \frac{[62]}{[61]} \frac{1}{p_{345}^2} \right). \tag{29}
 \end{aligned}$$

- Same for $\langle 3|4]$,

$$\begin{aligned}
 P^{\langle 3|4]} A + C^{\langle 3|4]} P^{\langle 5|6]} A = & c_B \left(-\frac{\langle 34 \rangle [6|1 + 5|2]}{\langle 24 \rangle [16] \langle 32 \rangle p_{234}^2} + \frac{[65][1|2 + 3|4]}{[15][16] \langle 42 \rangle p_{234}^2} \right) \\
 & + c_A \left(\frac{\langle 31 \rangle}{\langle 32 \rangle} \frac{1}{p_{456}^2} - \frac{[62]}{[61]} \frac{1}{p_{345}^2} \right).
 \end{aligned} \tag{29}$$

- The c_B part contains **spurious poles** $\langle 24 \rangle$ and $[15]$. This is why we choose $\langle 4|5]$ as the third deformation.

- Same for $\langle 3|4]$,

$$\begin{aligned}
 P^{\langle 3|4]} A + C^{\langle 3|4]} P^{\langle 5|6]} A = & c_B \left(-\frac{\langle 34 \rangle [6|1 + 5|2]}{\langle 24 \rangle [16] \langle 32 \rangle p_{234}^2} + \frac{[65] [1|2 + 3|4]}{[15] [16] \langle 42 \rangle p_{234}^2} \right) \\
 & + c_A \left(\frac{\langle 31 \rangle}{\langle 32 \rangle} \frac{1}{p_{456}^2} - \frac{[62]}{[61]} \frac{1}{p_{345}^2} \right). \quad (29)
 \end{aligned}$$

- The c_B part contains **spurious poles** $\langle 24 \rangle$ and $[15]$. This is why we choose $\langle 4|5]$ as the third deformation.
- Extract the constant term with respect to $\langle 4|5]$,

$$\begin{aligned}
 & C^{\langle 4|5]} P^{\langle 3|4]} A + C^{\langle 4|5]} \langle 3|4] P^{\langle 5|6]} A \\
 = & -c_B \frac{\langle 35 \rangle [64]}{[16] \langle 32 \rangle \langle 5|1 + 6|4]} + c_A \left(\frac{\langle 31 \rangle}{\langle 32 \rangle} \frac{1}{p_{456}^2} - \frac{[62]}{[61]} \frac{1}{p_{345}^2} \right). \quad (30)
 \end{aligned}$$

- Same for $\langle 4|5]$,

$$\begin{aligned}
 & P^{\langle 4|5]} A + C^{\langle 4|5]} P^{\langle 3|4]} A + C^{\langle 4|5]} \langle 3|4] P^{\langle 5|6]} A \\
 &= -c_B \frac{[6|1 + 5|3\rangle}{[16]\langle 32\rangle p_{234}^2} + c_A \left(\frac{\langle 31\rangle}{\langle 32\rangle} \frac{1}{p_{456}^2} - \frac{[62]}{[61]} \frac{1}{p_{345}^2} \right). \quad (31)
 \end{aligned}$$

This is the correct answer, which matches the result by Feynman diagrams.

- To change to the PC scheme, return to

$$P^{\langle 3|4]} A + C^{\langle 3|4]} P^{\langle 5|6]} A + C^{\langle 3|4] \langle 5|6]} A. \quad (32)$$

- To change to the PC scheme, return to

$$P^{\langle 3|4\rangle} A + C^{\langle 3|4\rangle} P^{\langle 5|6\rangle} A + C^{\langle 3|4\rangle \langle 5|6\rangle} A. \quad (32)$$

- And then

$$\begin{aligned} C^{\langle 3|4\rangle \langle 5|6\rangle} A &= P^{\langle 4|5\rangle} C^{\langle 3|4\rangle \langle 5|6\rangle} A \\ &= P^{\langle 4|5\rangle} A - P^{\langle 4|5\rangle} (P^{\langle 3|4\rangle} A + C^{\langle 3|4\rangle} P^{\langle 5|6\rangle} A), \end{aligned} \quad (33)$$

where

$$\begin{aligned} &P^{\langle 4|5\rangle} (P^{\langle 3|4\rangle} A + C^{\langle 3|4\rangle} P^{\langle 5|6\rangle} A) \\ &= c_B \left(-\frac{\langle 34\rangle [6|1 + 5|2\rangle]}{\langle 24\rangle [16] \langle 32\rangle p_{234}^2} + \frac{\langle 35\rangle [64]}{[16] \langle 32\rangle \langle 5|1 + 6|4\rangle} + \frac{[65] [1|2 + 3|4\rangle]}{[15] [16] \langle 42\rangle p_{234}^2} \right). \end{aligned} \quad (34)$$

- To change to the PC scheme, return to

$$P^{\langle 3|4\rangle} A + C^{\langle 3|4\rangle} P^{\langle 5|6\rangle} A + C^{\langle 3|4\rangle \langle 5|6\rangle} A. \quad (32)$$

- And then

$$\begin{aligned} C^{\langle 3|4\rangle \langle 5|6\rangle} A &= P^{\langle 4|5\rangle} C^{\langle 3|4\rangle \langle 5|6\rangle} A \\ &= P^{\langle 4|5\rangle} A - P^{\langle 4|5\rangle} (P^{\langle 3|4\rangle} A + C^{\langle 3|4\rangle} P^{\langle 5|6\rangle} A), \end{aligned} \quad (33)$$

where

$$\begin{aligned} &P^{\langle 4|5\rangle} (P^{\langle 3|4\rangle} A + C^{\langle 3|4\rangle} P^{\langle 5|6\rangle} A) \\ &= c_B \left(-\frac{\langle 34\rangle [6|1 + 5|2\rangle]}{\langle 24\rangle [16] \langle 32\rangle p_{234}^2} + \frac{\langle 35\rangle [64]}{[16] \langle 32\rangle \langle 5|1 + 6|4\rangle} + \frac{[65] [1|2 + 3|4\rangle]}{[15] [16] \langle 42\rangle p_{234}^2} \right). \end{aligned} \quad (34)$$

- In this case, to extract constant terms is much easier.

Conclusion

- To judge the correct result, there are three criteria:
 - (1) All spurious poles must be canceled out;
 - (2) The power of any physical pole must be at most one;
 - (3) It must have correct factorization limits for all physical poles.

Conclusion

- To judge the correct result, there are three criteria:
 - (1) All spurious poles must be canceled out;
 - (2) The power of any physical pole must be at most one;
 - (3) It must have correct factorization limits for all physical poles.
- There is **no need to beforehand analyze the large z behavior.**

Conclusion

- To judge the correct result, there are three criteria:
 - (1) All spurious poles must be canceled out;
 - (2) The power of any physical pole must be at most one;
 - (3) It must have correct factorization limits for all physical poles.
- There is **no need to beforehand analyze the large z behavior**.
- Further applications
 - (*) Multi-variables contour integral;
 - (1) Effective (nonrenormalizable) interactions;
 - (2) Other deformations: *i.e.*, Risager deformation;
 - (3) Rational parts of one-loop amplitudes with unitarity cut;
 - (4) Loop integrands from $\mathcal{N} = 4$ SYM to general QFTs.

Conclusion

- To judge the correct result, there are three criteria:
