SUGGESTED CEPC AND SPPS DATA RATE PROJECTION FORMAT

R. Talman, 21 January, 2015

INTERPRETATION

1. By scaling RF power inversely with R, most of the entries are independent of C.
2. The zeros in the t,t columns are because the beam energy is below threshold.
3. To avoid a lot of zero entries a huge "overvoltage" (80 MV) has been assumed for all entries.
4. The zeros in for E[GeV]=225 in the C=50 km table are because the "overvoltage" (80 MV) is insufficient.

REQUEST

4. e+e- entries broken out channel by channel.
5. p,p rates broken out similarly.

HUMOR

6. "day" = "Chinese day"
= "10^5 inverse fb @ 10^34 luminosity"
= 10,000 s
approx = 24 x 3600 = 86,400 s

TOLD YOU SO

7. Note that "bigger" is "cheaper".
