

CEPC Software Prototype

Zou Jiaheng

On behalf of the CEPCSW working group

2020.01.17

Mini-Workshop: Experiment/Detector @ HKUST

Introduction of CEPC Software

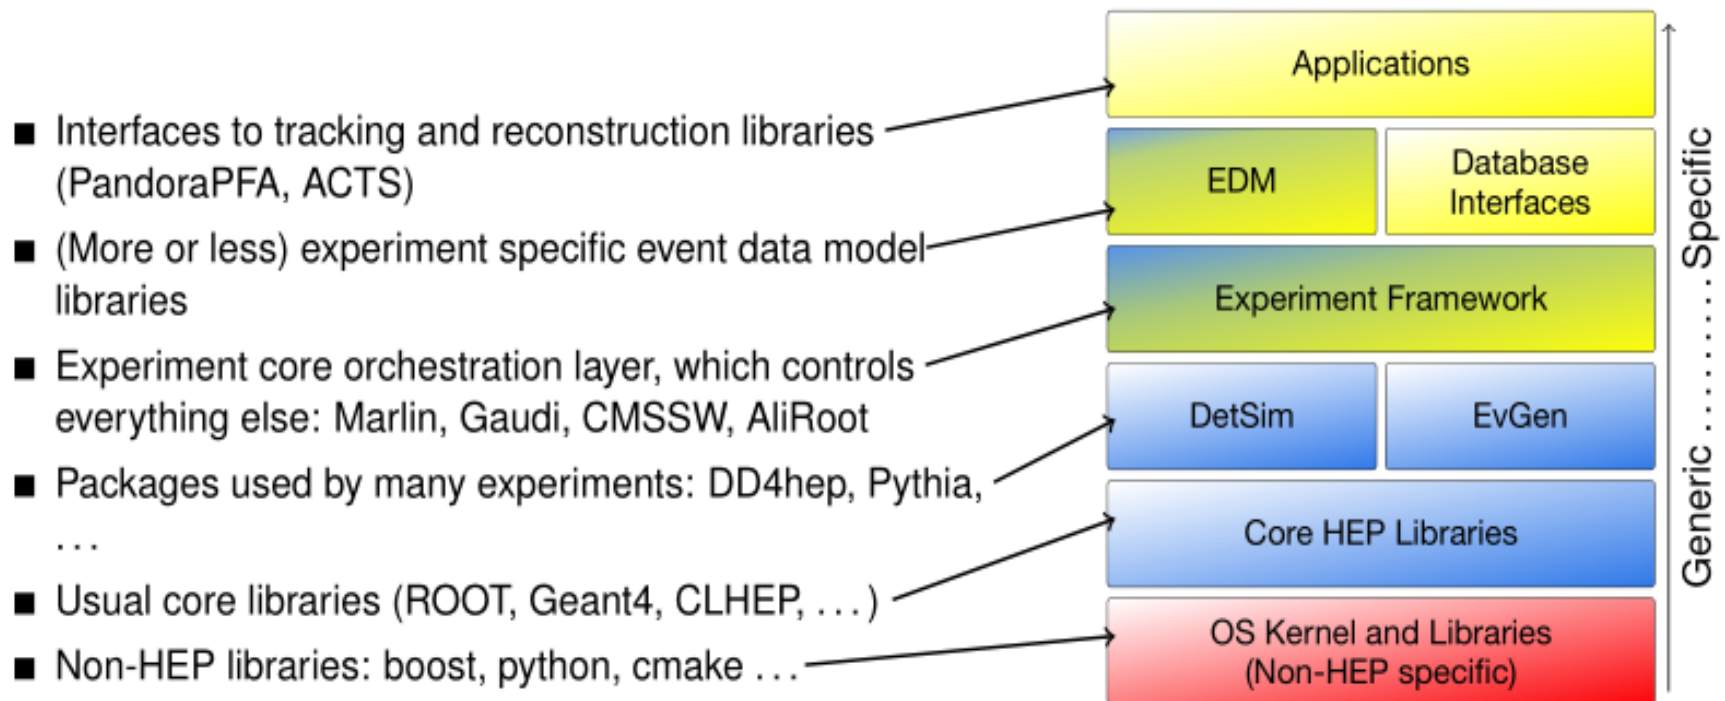

- ❖ CEPC software originally started from the iLCSoft (many thanks)
 - LCIO, Marlin, tracking and flavor-tagging
 - New components for CEPC: simulation, reconstruction...
 - Used for the CDR study, which is released in Nov, 2018
- ❖ A new framework for TDR is considered at the Oxford workshop, April 2019
 - to demonstrate the capabilities to meet future requirements
 - to support continuous integrations of new software components
- ❖ The agreement at the Bologna workshop, June 2019
 - A Common Software Stack (KEY4hep) for future collider experiments
 - CEPC, CLIC, FCC, ILC, SCTF
 - Software components sharing between experiments

A typical HEP Software Stack

[Ref]: André Sailer, etc. , CHEP2019

https://indico.cern.ch/event/773049/contributions/3474763/attachments/1938664/3213633/191105_sailer_key4hep.pdf

Applications usually rely on large number of libraries, where some depend on others

The Goal of CEPCSW Prototype

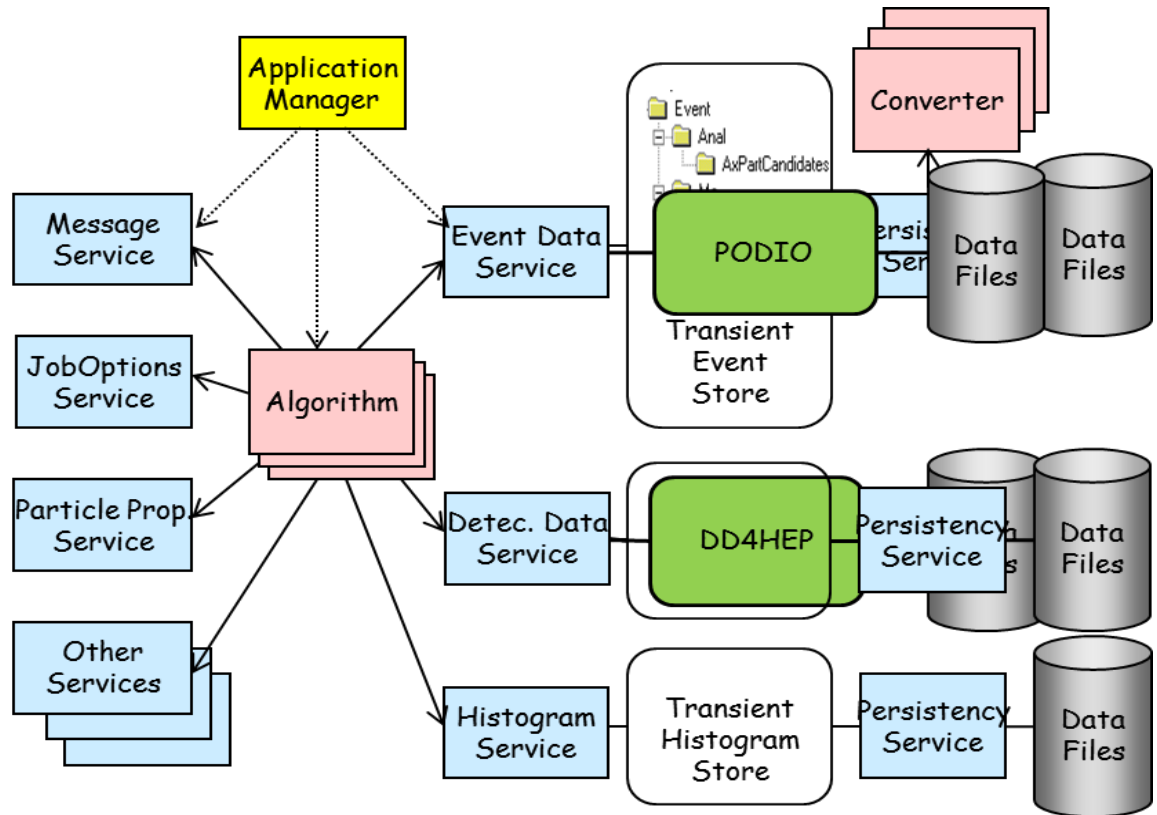

- ❖ Based on KEY4hep (Common Software Stack for HEP)
- ❖ Reuse existing components
 - EDM4hep/PODIO, DD4hep, Gaudi, ROOT ...
- ❖ Implement the specific components for CEPC
- ❖ Provide a ready-to-work environment to algorithm developers and physicists
 - Porting tracking algorithms from iLCSoft to CEPCSW
 - Integrate more algorithms and features
- ❖ Move to the new software system finally

Tasks of CEPCSW Prototype

Components	Tasks	Status
General	Software infrastructure Core modules	√
EDM & I/O	PLCIO data model and I/O LCIO compatible reader	√
Geometry and Simulation	DD4hep integration Simulation framework	√
Reconstruction	SiliconTracking	√
	More reconstruction algorithms	In progress
Build and release	Git, CMake, CVMFS	Ready

Gaudi: the Underlying Framework

- ❖ The core part of the framework is small
- ❖ key components:
 - Application Manager
 - Services
 - Algorithms
 - Tools

- ❖ Data is separated from algorithms – physicists can concentrate on the algorithms
- ❖ Originally developed for LHCb, also used by BESIII and DYC in China

The Gaudi Framework

❖ Application manager: the job controller

- Creation, configuration and management of services and algorithms
- Algorithm scheduling during the event loop
- Terminating the job properly

❖ User components

- Algorithm: the concrete calculations to the event
- Service: the common functions which can be invoked by users
- Tool: subroutines belong to an algorithm

❖ High Performance Computing

- Multithreading computing is supported since v29
- Parallelized functional and reentrant algorithms
- Transparent data management in memory

PODIO: an Event-Data Model toolkit

[Ref]: F. Gaede, etc. , CHEP2019

https://indico.cern.ch/event/773049/contributions/3473254/attachments/1939721/3215730/gaede_podio_chep19.pdf

PODIO is originally developed in context of the FCC study

- user layer (API):
 - handles to EDM objects (e.g. **Hit**)
 - collections of EDM object handles (e.g. **HitCollection**).
- object layer
 - transient objects (e.g. **HitObject**) handling *references* to other objects and *vector members*
- POD layer
 - the actual POD data structures holding the persistent information (e.g. **HitData**)

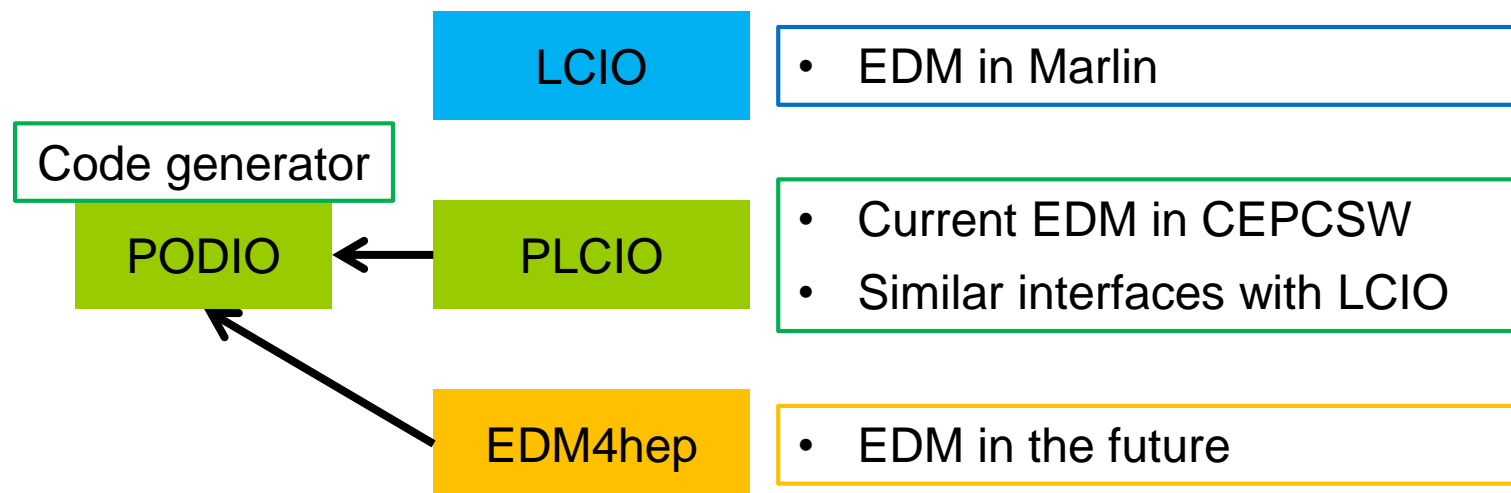

direct access to POD also possible - if needed for performance reason

EDM4hep

- ❖ The EDM4hep project is being constructed in the context of CSS
 - Based on LCIO and FCC-edm
- ❖ Provide a common event data model
 - Common core classes described in a yaml file
 - C++ Code is generated by **PODIO**
 - The persistency layer (ROOT, HDF5, ...) can be changed easily
 - Each experiment can implement their own extensions
- ❖ A project followed by HEP Software Foundation
 - Regular meeting in every 2 weeks (CERN, DESY, IHEP ...)
 - <https://github.com/HSF/EDM4hep>
- ❖ But, a substitute is necessary for CEPCSW at present

Current EDM in CEPCSW Prototype

- ❖ **PLCIO** is used temporarily in current CEPCSW
- ❖ PLCIO is an implementation of the LCIO event data model in PODIO

- ❖ (I suppose) CEPCSW is the first user of PLCIO
 - A few classes in LCIO are not present in PLCIO now
 - ObjectID in PLCIO is not straightforward to retrieve the correlated object
 - Going to develop helper classes or Gaudi services to facilitate event navigation with data objects' relations

FWCore

❖ FCCSW FWCore

- DataWrapper: PLCIO data collection -> DataObject in Gaudi
- DataHandle: user interface to register/retrieve data to/from Gaudi TES (Transient Event Store)
- PODIO data service: read/write PODIO data objects

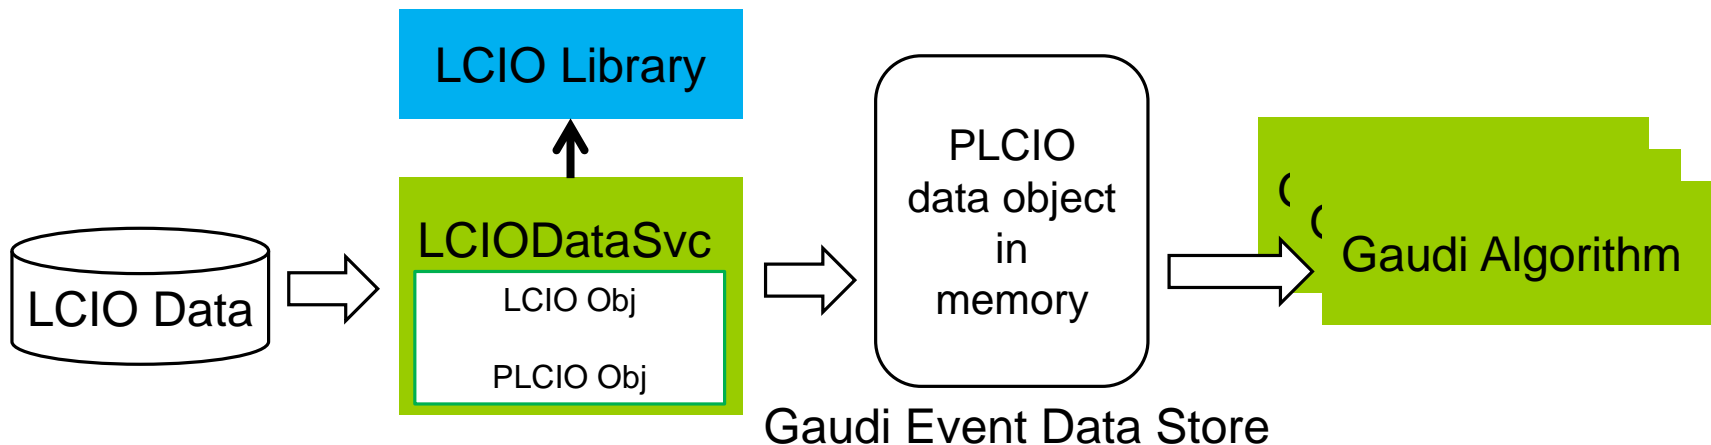

❖ CEPCSW FWCore

- Mainly taken from FCCSW FWCore (many thanks)
- Extension to read LCIO data generated by Marlin

Read the Existing LCIO Data

❖ LCIODataSvc

- Read LCIO files via the LCIO library
- Convert LCIO data objects to PLCIO data objects
- Register PLCIO data objects to Gaudi Event Data Store

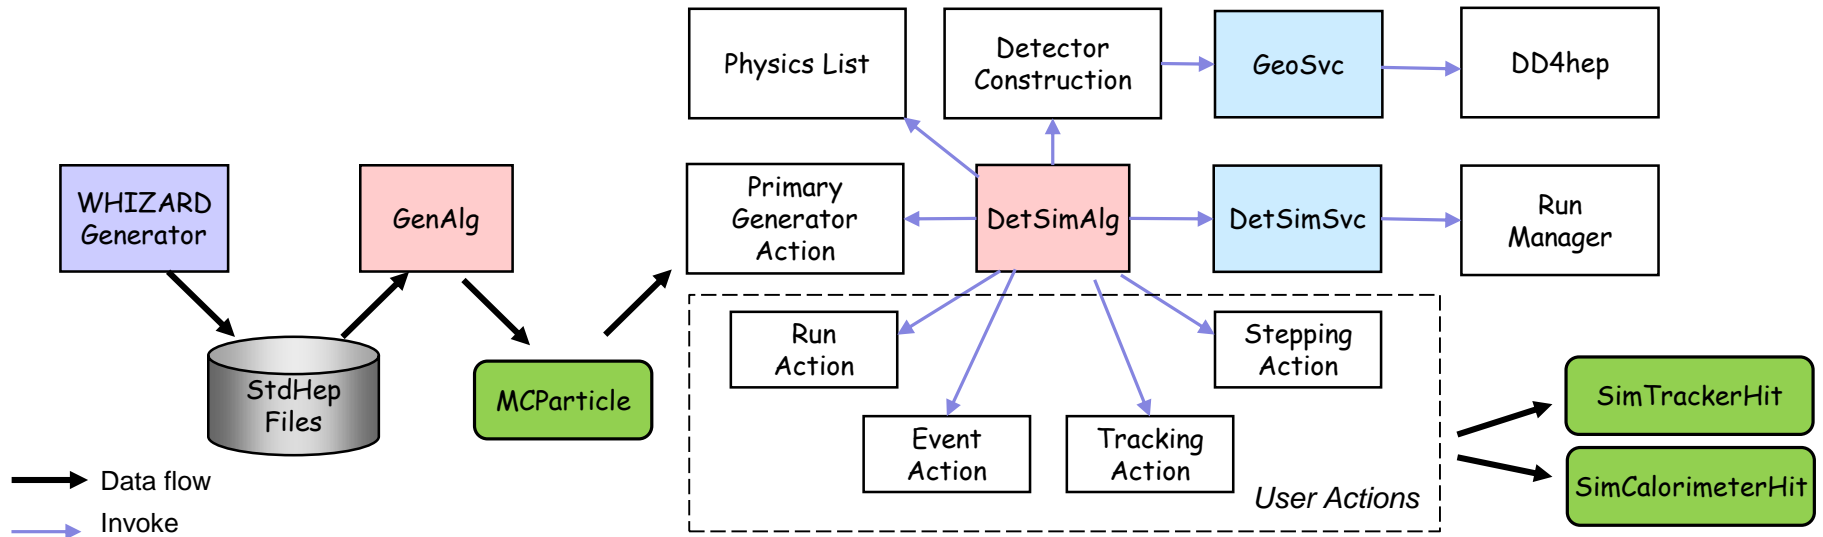

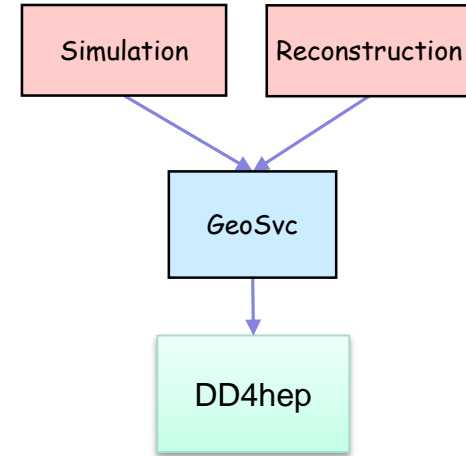

❖ Current Status

- Most LCIO data types can be retrieved as PLCIO objects in CEPCSW
- Some of the data relations are not fully recovered (there are some limitation for data analysis now)

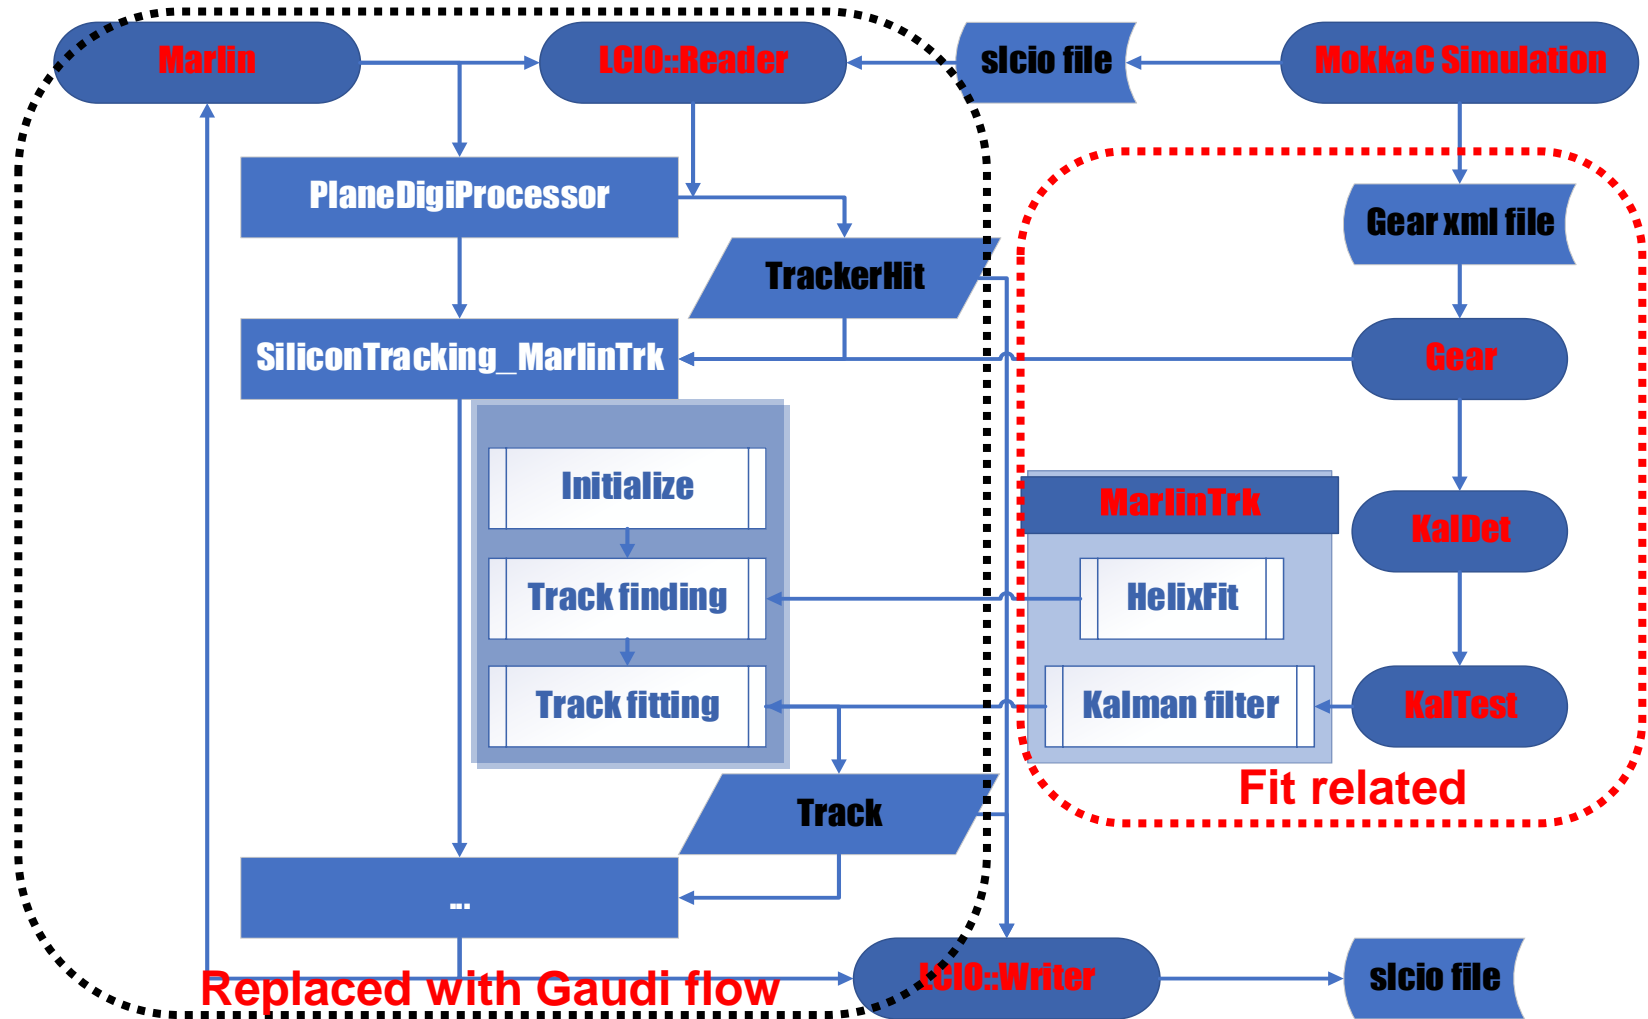

Detector Description and Simulation

- ❖ Unified Geometry Service
 - Interfaced to DD4hep
 - Used by simulation and reconstruction
- ❖ Simulation tool
 - Integrated with physics generator & Geant4
- ❖ See Tao's report in this afternoon

Reconstruction: SiliconTracking

As a first step, the SiliconTracking algorithm is ported from iLCSoft to CEPCSW
The results are intelligible same as Marlin's.

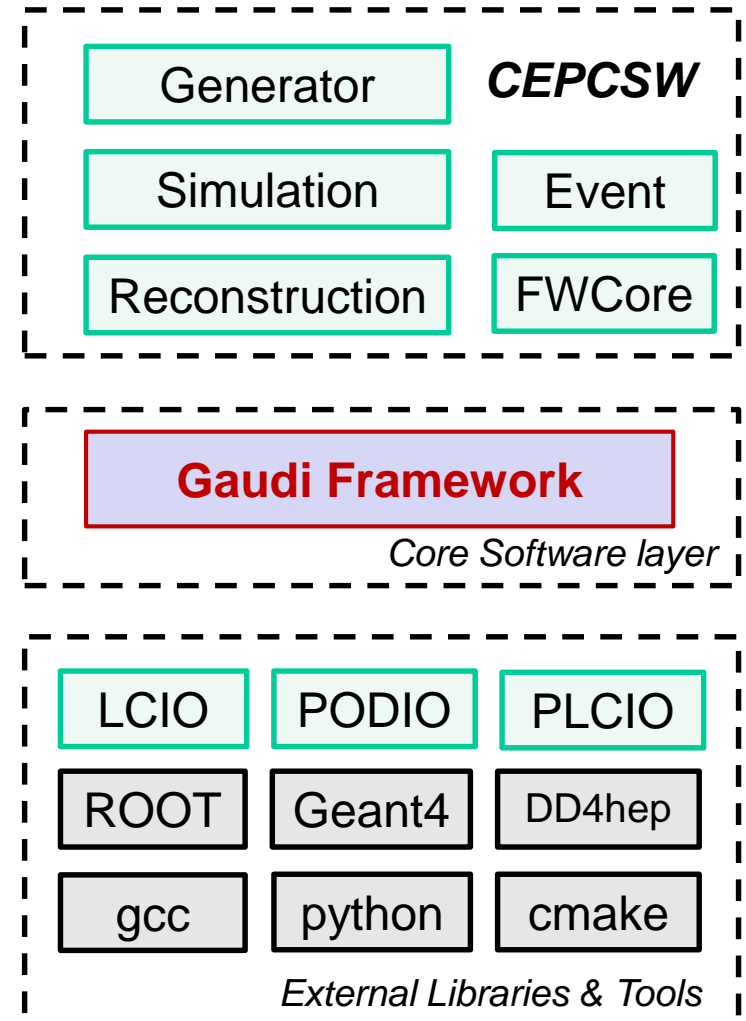

Software Infrastructure and Building

❖ Common tools

- **CMake**: Build & deployment
 - Gaudi cmake macros
- **Git**: version control
 - <http://cepcgit.ihep.ac.cn/cepc-prototype>
- **CVMFS**: software distribution
 - CEPC specific:
[/cvmfs/cepcsw.ihep.ac.cn/prototype](http://cvmfs/cepcsw.ihep.ac.cn/prototype)

❖ Software building

- Based on FCCSW & LCG software stack now (many thanks)
- Move to **KEY4hep** in the future

A Preliminary Testing

- ❖ A digitization algorithm ported from iLCSoft
 - PlanarDigiProcessor → PlanarDigiAlg
- ❖ Geometry: GearSvc migrated from Marlin
- ❖ Data and I/O
 - Read .slcio (LCIO) format files generated by Marlin with LCIODataSvc
 - Write .podio (PLCIO) format files with PodioDataSvc
- ❖ Compare the results with Marlin

Results

- ❖ The results of CEPCSW and Marlin are exactly the same

```
Attaching file PlanarDigi_marlin.root
(TFile *) 0x7fc1ef93ea70
root [1] planarDigi->Show(13000)
=====> EVENT:13000
side          = 0
layer         = 3
module        = 8
sensor        = 0
theta_xcar    = 1.5708
phi_xcar      = 1.428
theta_ycar    = 8.65927e-17
phi_ycar      = -2.49899
edep          = 4.89194e-05
```

```
Attaching file PlanarDigi_gaudi.root
(TFile *) 0x7f9b39d043d0
root [1] planarDigi->Show(13000)
=====> EVENT:13000
side          = 0
layer         = 3
module        = 8
sensor        = 0
theta_xcar    = 1.5708
phi_xcar      = 1.428
theta_ycar    = 8.65927e-17
phi_ycar      = -2.49899
edep          = 4.89194e-05
```

Execution efficiency: no significant difference between the jobs' wall time

Future Plans

- ❖ Software porting from Marlin/iLCSoft to CEPCSW
 - Algorithms (reconstruction)
 - Geometry management: GEAR in Marlin -> DD4hep
- ❖ Software improvements and new components
 - Recover the relations between PLCIO data object
 - Common services, such as database accessing
- ❖ Parallel Computing with latest Gaudi
 - Writing functional and reentrant algorithms
 - EDM & I/O performance analysis and optimization
- ❖ Integration with ACTS, Tensorflow, etc.
- ❖ Integration with KEY4hep

Summary

- ❖ CEPCSW prototype has been developed using Gaudi, DD4hep, Geant4 and PLCIO, etc.
- ❖ In the prototype
 - Both detector simulation and tracking algs can be run successfully
 - By implementing data conversion, previously produced MC data can be reused
- ❖ It is ready to add more algorithms to the prototype following given examples
- ❖ Future development will be based on KEY4hep collaborating with other future collider experiments

Thank You !
谢谢
